

ABSTRACT

5 A contents synthesizing apparatus includes an input receiving portion (S11) receiving an input of first contents data including a synthesizing script describing synthesis of contents data and an input of second contents data, and a synthesis processing portion (S13) synthesizing the input first contents data with the input second contents data, based on the synthesizing script included in said input first contents data. Therefore, it becomes unnecessary to newly prepare a synthesizing script required for synthesizing contents data.
